DETAILED ACTION

Allowable Subject Matter

1. Claims 1, 2, 4-8 and 25-27 are considered allowable over the cited prior art of record.

The following is an examiner's statement of reasons for allowance:

The main cited prior art references cited, Brook (US 2002/0038320) and Call (US 2002/0143521), and other prior art fail to teach or suggest all of the claim limitations.

Brook teaches the validation of markup language documents based on syntactic attributes and hashed representations of the document structural elements in the structural representation of the document. Brook teaches the parsing of a document (e.g. in XML) but fails to teach the determination of whether a character data value is valid with respect to a predefined data structure as defined in claim 1.

Call teaches the utilization of a data structure to store and index using integer values of a character wherein Call teaches a method of storing fixed and variable length data in a data structure (e.g. an array). Further, Call teaches character data being represented by natural language text parsed into logical subdivisions that encapsulate the meaning of the original language text. The data size of each integer is smaller than the corresponding text that the integer represents. Call teaches the representation of entire natural language words as a single integer and storing those integers in an array. Call therefore does not clearly teach whether a retrieved data value represents a valid character within the given markup language specification according to a logical combination of a plurality of status values.

Therefore, the combination of the cited prior art and other prior art fail to teach or suggest "determining whether a character represented by said data value is a valid character as defined in the given markup language specification, wherein determining whether said character represented by said data value is a valid character comprises: locating a member of a data structure, said member having a direct correspondence to said retrieved value, and determining whether said retrieved data value represents a valid character within the given markup language specification according to a logical combination of a plurality of status values in said located member of said data structure."
